

Module-5

Reading Material:

In the previous modules we have seen how to access the characters in the string. Now it is very easy to access the last letter.

To access the last character we can use two methods

1)

```
>>>s="HelpA"
```

```
>>> print s[-1]      #To print the last character
```

```
A
```

2) Print True if the given string ends with 'A'?

```
>>>s="HelpA"
```

```
>>>print s.endswith('A')
```

```
True
```

Problem Set:

- 1) Print the true if the string has same first and last character?
- 2) Print all the last characters in the given file?
